

**The most advanced
Macintosh repair
utility.**

Ever.

New Version 7!

We're pleased to announce the all-new TechTool Pro 7! This is the most advanced version of the acclaimed Macintosh troubleshooting utility created in its 20-year history. We've redeveloped TechTool Pro 7 to be fully 64-bit compatible, which allows the program to run most efficiently on the latest Macintosh computers. We've also added a fantastic new RAM test that can find problems which no other utility can. We've also improved many of the testing, repair and maintenance routines.

Memory Test

Many users and technicians overlook RAM problems when troubleshooting a system, mostly because it's so difficult to properly test. But with the wide availability of inexpensive memory modules, RAM problems are quite prevalent and can cause a variety of crashes, program errors and even data loss. We've seen many cases where a user will be chasing down a disk or extension problem when their issue was simply a faulty and inexpensively replaced memory module. We've taken almost 2 years to develop one of the most advanced memory tests in the industry that will help technicians and users alike diagnose and isolate this common, but often missed issue. As part of the RAM test, we've also added a fantastic SPD report that shows you an enormous amount of technical and other interesting information about your computer's memory.

New Models and Mavericks

TechTool Pro 7 works with the latest summer release of Macintosh computers. It also works perfectly on the developer release of the new version of Mac OS X, "Mavericks."

Improved Tests

Besides the Memory test, we've improved many of the existing tests in TechTool Pro 7 to run more efficiently and to find and repair more problems than the previous version. We've also greatly improved our volume optimization feature.

We think you'll find TechTool Pro 7 to be the most valuable addition to your Macintosh toolbox. You can use these links to get [more information](#), or [buy now](#).
